sequence to be used as a colony primer can include any sequence, but preferably includes 5'-AGAAGGAGAAGGAAAGGGAAAGGG (SEQ ID NO:1) or 5'-CACCAACCCAAACCAACCCAAACC (SEQ ID NO:2). The colony primer can be 5 to 100 bases in length, but preferably 15 to 25 bases in length. Naturally occurring or non-naturally occurring nucleotides may be present in the primer. One or two different colony primers may be used to generate nucleic acid colonies in the methods of the present invention. The colony primers for use in the present invention may also include degenerate primer sequences.--

--The properties of the colony primers have been chosen based on a selection for oligonucleotide primers that show little non-specific nucleotide incorporation in the presence of heat-stable DNA polymerases. The colony primers, CP (5'-p CACCAACCCAAACCAACCCAAACC) SEQ ID NO:2 and CP (5'-p AGAAGGAGAAGGAAAGGGAAAGGG) SEQ ID NO:1 have been selected due to their low incorporation of radiolabeled [^{32}P-dCTP] in the presence of a stable DNA polymerase (AmpliTaq, Perkin Elmer, Foster City, CA) in the standard buffer and under thermocycling conditions (94 C for 30 seconds, 65 C for 1 minute, 72 C for 2 minutes, 50 cycles).--

-- A 3.2 Kb DNA fragment was taken as a model system to demonstrate the feasibility of colony generation from random primer PCR amplification. This strategy can be applied to sequencing of DNA fragments of approximately 100 Kb in length and, by combination of fragments to whole genomes. A fragment of DNA of 3.2 Kb was generated by PCR from human genomic DNA using PCR primers; TP1 5'-pGAGGCCAGAACAGTTCAAGG (SEQ ID NO:3)and TP2 5'-pCCTGTGACAAGACGACTGAA SEQ ID NO:4 as described in example 1. The 3.2 Kb fragment was cut in smaller fragments by a combination of restriction enzymes (EcoR1 and HhaI yielding 4 fragments of roughly 800 bp). The cut or uncut fragment DNAs were then mixed with the degenerate primer, p252 (5'-P TTTTTTTTTTISISISISISIS, SEQ ID NO:17 where I stands for inosine (which pairs with A, T and C) and S stands for G or C) and covalently coupled to the Nucleolink wells (Nunc, Denmark). The tubes were then subjected to random solid phase PCR amplification and visualized by hybridisation with labeled DNA probes, as will be described in Example 2a.--

wells (Nunc, Denmark) in the presence of varying doses of Template A (prepared as described in example 1). 8 wells were set up in duplicate with seven 1/10 dilutions of template with CP2, starting with the highest concentration of 1 nM.--

Probe: The probe was a DNA fragment of 1405 base pairs comprising the sequence of the template at their 3' end (nucleotide positions 8405 to 9259). The DNA probe was synthesized by PCR using two primers: p47 (5'-GGCTAGGAGCTGAGGAGGAA) SEQ ID NO:20, amplifying from base 8405, and TP2, biotinylated at 5' end, amplifying from base 9876 of the antisense strand.--

Series of 8 wells were set up in triplicate with seven 1/10 dilutions of both templates starting with the highest concentration of 1 nM. Template dilutions are set up in opposite directions such that the highest concentration of one

template coincides with the lowest of the other.--

On both glass slides sides, 3.5 µl of the mixture were loaded, and incubated over night at room temperature. The glass slides were then briefly rinsed with 5xSSC buffer and placed at 100 C in 10mM Tris buffer pH 8.0 for 2x5'.--

thermo-cycler (MJ Research, Watertown, MA). Each slide was digested twice using 1.3 units of Pvu II (Stratagene) in NEB 2 buffer (New England Biolabs) for 45 minutes at 37 C. After digestion, the tubes were placed at 100 C in 10mM Tris buffer pH 8.0 for 2x5', then blocked with filtered (Millex GV4, Millipore) 1 mg/ml BSA in 2xSSC buffer for 30' at room temperature and rinsed first in 2xSSC 0.1% SDS buffer then in 5xSSC buffer. Each slide was incubated over night at room temperature with a 5xSSC/0.1% Tween 20 buffer containing 1 µM of the sequencing primer p181 (CGACAGCCGGAAGGAAGAGGGAGC) SEQ ID NO:18 overnight at room temperature. Controls without primer were kept in 5xSSC 0.1% Tween 20 buffer. Glass slides were washed 2 times in 5xSSC 0.1% SDS at 37C for 5' and rinsed in 5xSSC. -- cDNA synthesis - Synthetic mRNA was mixed with mouse liver poly A+ mRNA at different molar ratios (1:1, 1:10, 1:100) and cDNA synthesis on the mixture of synthetic and mouse liver mRNA was performed using the "SMART PCR cDNA synthesis kit" (Clontech, Palo Alto CA) with some minor

modifications. In a cDNA reaction, approximately 1 µg of the mRNA mixture was mixed with the -primer CP5, having at the 5' -end the sequence of CP, (5'p-AGAAGGAGAAGGAAAGGGAAAGGGTTTTTTTTTTTTTTTNN) SEQ ID NO:9. This primer has been used to make the 1st strand cDNA synthesis. For the 2nd strand synthesis, the "SMART" technique has been used. The basis of the SMART synthesis is the property of the Moloney murine viral reverse transcriptase to add three to five deoxycytosine residues at the 3'-termini of first strand cDNA, when the mRNA contains a 5'-methylguanosine-cap (SMART user manual, Clontech, Palo Alto CA). A CP6 primer, which contains the sequence of CP plus AAAGGGGG (SEQ ID NO:21) at the 3' end, (5'p-AGAAGGAGAAGGAAAGGGAAAGGGGG) SEQ ID NO:10 has been used for the 2nd strand cDNA synthesis. Buffer and SUPERSCRIPT™ II RNase H- reverse transcriptase from Moloney murine leukemia virus (Life Technologies, Ltd.) were used as described in the instructions and the reaction was carried out at 42 C for 1 hr. The cDNA was assayed by PCR using the primer p251, which contains a fragment of the CP sequence, (5'-GAGAAGGAAAGGGAAAGG) SEQ ID NO:19 with Taq DNA polymerase (Platinum Taq, Life Technologies, Ltd.).—

The wells were then placed in the thermocycler and for 33 repetitions under the following conditions: 94°C for 45 seconds, 60°C for 4 minutes, 72°C for 4 minutes. After completion of this program, the wells were rinsed with 5xSSC, 0.1% Tween 20 and kept at 8°C until further use. Excess ^{32}P dATP was removed with a Chroma Spin column TE-10 (Clontech, Palo Alto CA). Radiolabeled oligonucleotides (0.5 µM in 5xSSC, 0.1% Tween 20) were then hybridized to the oligonucleotide derivatized Nucleolink wells at 37°C for two hours. The wells were washed 4 times with 5xSSC, 0.1% Tween 20 at room

temperature, followed by a wash with 0.5xSSC, 0.1% Tween 20 for 15' at 37°C. Wells were then assayed for bound probe by scintillation counting.--
